

measX Press Release

June 2009

X-Crash ATD 3.0 – Analysis system for ATD calibration tests

With X-Crash ATD 3.0 measX provides the latest version of the turn-key software solution for dummy calibration tests. As before version 3.0 is based on the reliable standard software DIAdem from National Instruments. X-Crash ATD provides functionality for importing and administration of test data, analysis and reporting.

X-Crash ATD provides a file based, easy-to-use data administration (no database and related maintenance is necessary). This data administration keeps the test data, results, reports and all necessary information. Data will be analysed automatically (optionally with trigger and offset correction) and the results will be compared with the specific requirements. The results will be presented on report pages, which include a result table and diagrams with channels and corridors.

After a complete calibration the results are summarized in a report with a summary and comment sheet and all test results sorted from head to foot

A variety of output formats is available. In case of a PDF report, bookmarks will be added for easy navigation.

As X-Crash 3.0 itself X-Crash ATD allows flexible and powerful customer specific extensions.

- Powerful customizing by using VBScript and DIAdem functionality.
- Creating company specific report layouts
- Company logo or logo of companies customer
- Extendable user interface

X-Crash ATD will be maintained continuously. All great variety of ATD types is already supported. If you have the requirement for additional ATD types, please contact measX.

About measX

With over 25 years' experience, measX GmbH & Co. KG offers consulting services and turnkey systems for the acquisition, management, and evaluation of measured data. measX has all the expertise required to provide everything from signal conditioning, data acquisition, and automation, through to user interfaces and control.
